

Should you use a solar battery if you have net metering?

If your state offers full retail net metering, you can probably skip the battery as it won't save you any additional money on your electricity bill. If the utility bills solar customers using a method besides net metering, a battery makes more financial sense, as it'll give you the full value out of each kilowatt-hour of energy stored.

What is net metering & how does it work?

Net metering is a billing structure that incentivizes homeowners to install solar panels by purchasing excess solar power the panels generate. Utility companies don't follow all the same rules when it comes to billing solar customers. Usually, there are three types of net metering you may come across: 1. Full-retail net metering

Are solar batteries worth it?

But if your state has bad net metering policies, no net metering at all, or uses Time-of-Use utility rates, a battery makes sense for you. The best way to find out if solar batteries are worth it near you is by connecting with local solar companies.

Do solar panels produce more electricity during the day?

Solar panels typically produce the most extra electricity during the middle of the day, which also happens to be when electricity is the cheapest, meaning you save less with Time-of-Use net metering than a standard full retail program. 3. Avoided-cost net metering

Do you need off-peak solar power metering?

Most utilities with time-of-use net metering require off-peak excess generation to only offset future off-peak usage or only be worth the off-peak amount. This means that excess solar power generated during off-peak hours will never fully cover the cost of energy you take from the grid later in the day.
